

Ubuntu Sales Engineer (Entry-Level)

Philipp Oliver Laurence Goetting

19th of January 2026

Dear Hiring Team,

I want to bring my technical hands-on experience and customer discovery skills to Canonical's mission of accelerating Ubuntu adoption across enterprises. With 3+ years working between technical and business teams at Fidelity International, advanced Python/SQL skills from my M.Sc. thesis (200M+ row pipelines), and proven ability to translate customer challenges into concrete open source solutions, I'm excited to help global companies embrace Ubuntu Pro, Kubernetes, and Canonical's cloud-native stack.

At Fidelity , I conducted interviews across Finance, IT, and Compliance to map their data flows to business processes, built data dictionaries, and collaborated with the COO team to deliver working governance solutions (Collibra/SAS). This mirrors presales cycle: collecting business requirements, identifying open source challenges, and Clearly defining the value of Ubuntu Pro

My Linux familiarity comes from extensive data engineering work—processing massive datasets through cloud pipelines (AWS S3), containerized workflows, and API integrations. Combined with intermediate Python skills (pandas, scikit-learn, ETL automation), I'm ready to dive into Ubuntu Pro demonstrations, OpenStack configurations, and Kubernetes architecture discussions.

I love Canonical's distributed-first culture (1000+ colleagues, 70+ countries) and founder-led focus on open source innovation. Ubuntu powers AI/ML/data science—the exact domains where I've built production solutions. The opportunity to travel globally while working remotely aligns perfectly with my international experience (Switzerland, UK, USA).

I excel at understanding customer technical landscapes, asking the right discovery questions, and delivering clear Ubuntu Pro value propositions. Eager to help enterprises solve real problems with Canonical's platform.

Kind regards,

Philipp Oliver Laurence Goetting
